The IL-lbeta binding molecules of the invention are used to treat IL-l mediated diseases or disorders e.g. septicemia, septic or endotoxic shock, allergies, asthma, bone loss, ischemia, stroke, rheumatoid arthritis, autoimmune diseases (e.g. hemolytic anemia, spstemic lupus erythematosus, myasthenia gravis, crohn's disease, inflammatory bowel syndrome, Graves disease, multiple sclerosis) and inflammatory disorders (e.g. bronchitis and pulmonary emptyagema), adult respiratory disorders (e.g. bronchitis and pulmonary severe burns, cachexia, cancer, IL-l-dependent tumors and acquired immunodeficiency syndrome (AIDS)-related cachexia. The IL-lbeta binding ranglant patients. The present sequence represents a complementarity determining region (CDR) of the light chain variable domain of antibody

The present sequence is given in a specification relating to a novel human antibody that is capable of recognising the Epithelial Glycoprotein. 2 (ECP-2) antigen. The antibody is useful for prevention and/or treatment of conditions associated with cancer. Such conditions include solid tumours, blood born tumours such as leukaemia, tumour metastasis, benign tumours, for e.g. haemangiomas, accustic neuromas, rheumatoid arthritis, psoriasis, ocular angiogenic diseases, diabetic retinopathy, myocardial angiogenesis, telangiectasia, wound granulation, angiogenesis, clashetic neutibody is useful for invivo imaging of cancer and for adjuvant treatment of cancer. Vectors expressing the antibody are useful for inducing an immunological response in a mammal in vivo. The vector is selected from fowl pox virus (FPV), canary pox (ALVAC), entomopox virus, vaccinia virus such as modified virus ankara (MVA) and NYVAC or other non-replicating viral vector systems in order to provide a dual immunotherapeutic approach
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a method of inhibiting tumour growth which involves administering, vascular endothelial growth factor receptor (WEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, head and neck, ovary, prosette, brain, pancreas, skin, come marrow, blood, thymus, uterus, testicles, cervix or liver) over expresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours, preferably high vascular tumours and non-solid tumours. The inhibition or reduction of tumour growth includes prevention or inhibition of the progression of tumour includes prevention or inhibition of the progression of tumours includes the invasiveness metastasis, recurrence and increase in size of the tumour. The present sequence is human NSCR (VEGFR-2). Fab antibody light chain complementarity determining
                                                                                                                              Human; tumour; vascular endothelial growth factor receptor; metastasis; spidermal growth factor receptor; non-small cell lung carcinoma; NSCLC; breast; VBGFR; heart; EGFR; complementarity determining region; therapy; invasiveness; CDR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting tumor growth in humans involves administering vascular endothelial growth factor receptor antagonists in combination with radiation, chemotherapeutic agents, or epidermal growth factor receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 49; DB 5; Length 11; 100.0%; Pred. The invention relates to an isolated mammalian anti-dual integrin
antibody having at least one of the human heavy chain or light chain
complementary determining region (CDR, HC CDR1-CDR3, LC CDR1-3). Also
included are the nucleic acids encoding the CDRs, a vector comprising the
complementary determining region (CDR, HC CDR3, an anti-diotype
included are the nucleic acids encoding the CDRs, a vector comprising
contained that binds to the ant-dual integrin, a medical device comprising
the antibody suitable for administration by parenteral, subcutaneous,
intraabdominal, intravenous, intracticular, intrabronchial,
intraabdominal, intracapsular, intracartilaginous, intracavitary,
intracabelebellar, or other routes as given in specification. The antibody
is useful for diagnosing or treating a dual integrin related condition in
an animal for example, immune related disease such as rheumatoid
contained an animal, diabetes, cardiovascular disease such as
arteriosclerosis, atherosclerosis, restenosis, angina pectoris,
current, and fungal infections disease in a cell such as bacterial,
curral, and fungal infections, pneumonia, leprosy, malaria; malignant
cdisease such as leukaemia, chronic myelocytic leukaemia, Burkit's
lymphoma, multiple myeloma; neurological disease such as multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                    Human; antibody; dual integrin; CDR; light chain variable region; LC CDR; medical device; immune related disease; rheumatoid arthritis; gastric ulcer; asthma; allergic rhinitis; Crohn's pathology; sickle cell anaemia; diabetes; cardiovascular disease; arteriosclerosis; atherosclerosis; restenosis; angina pectoris; myocardial infarction; infectious disease; pneumonia; leprosy; malaria; malignant disease; leukaemia; chronic myelocytic leukaemia; multiple myeloma; neurological disease; multiple sclerosis; Parkinson's disease; Alzheimer's disease; Creutzfeldt-Jakob disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated mammalian anti-dual integrin antibody, useful for diagnosing or treating dual integrin related condition such as rheumatoid arthritis, gastric ulcer, asthma, atherosclerosis, restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sclerosis, Parkinson's disease, spinal ataxia, Alzheimer's disease,
Creutzfeldt-Jakob disease and many other diseases given in the
specification. The present sequence is an anti-dual integrin human light

The invention relates to a method of inhibiting tumour growth comprising administering to a human a vascular endothelial growth factor receptor (VEGFR) antagonists and epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibiting tumor growth by administering to a human a vascular endothelial growth factor receptor (VEGFR) antagonist and epidermal growth factor receptor (EGFR) antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                monoclonal antibody; heavy chain variable region; light; framework; complementerity determining; CDR1; FR1; FR2; CDR2; FR3; CDR3; FR4; prostate specific embrane antigen; PSW4; cytostatic; tumour; colon cancer; renal carcinoma; gene therapy; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ठे
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel antibody having a first antigen binding site specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a human peptide relating to the bispecific antibodies that bind to the VEGF receptors of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New bispecific antibodies having antigen-binding sites specific for a first vascular endothelial growth factor (VEGF) receptor and for a second VEGF receptor, useful for inhibiting migration of leukemia cells, or for

The invention relates to a novel isolated human monoclonal antibody comprising a human heavy chain variable region and a human light chain variable region both comprising FR (framework region)-1, CDR (complementarity determining region)-1, FR2, CDR2, FR3, CRD3 and FR4 sequences. The antibody is directed against the human prostate specific membrane antigen (PSMA). The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating or preventing a disease characterised by the growth of tumour cells such as cancer, particularly prostate cancer, colon cancer or renal carcinoma, as well as duing gene therapy procedures. The current sequence is that of the human light chain variable region CDR1 peptide of the invention.
                                                            New isolated human monoclonal antibody comprising a human heavy chain a human light chain variable regions, both comprising FR1, CDR1, FR2, CDR2, FR3, CRD3 and FR4 sequences, useful for treating or preventing

variable region both comprising FR (framework region)-1, CDR (complementarity determining region)-1, FR2, CDR2, FR3, CRD3 and FR4 sequences. The antibody is directed against the human prostate specific membrane antigen (PSMA). The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating or preventing a disease characterised by the growth of tumour cells such as cancer, particularly prostate cancer, colon cancer or renal carcinoma, as well as duing gene therapy procedures. The current sequence is that of the human light chain variable region CDR1 peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel isolated human monoclonal antibody comprising a human heavy chain variable region and a human light chain variable region both comprising FF (framework region)-1, CDR (complementarity determining region)-1, FRZ, CDRZ, FRZ, CRD3 and FR4 sequences. The antibody is directed against the human prostate specific membrane antigen (FSMA). The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating or preventing a disease characterised by the growth of tumour cells such as cancer, particularly prostate cancer, colon cancer or renal carcinoma, well as duing gene therapy procedures. The current sequence is that of the human light chain variable region CDRI peptide of the invention.

The present sequence is that of complementarity determining region 1

(CDR1) of the light chain variable region of claimed mammalian anti-
tumour necrosis factor (TNF) antibodies of the invention. The CDR is
derived from a human TNF reactive IGG monoclonal antibody generated by
cloning variable and constant region DNA in vector pC4 and expression in
CMO cells. The invention provides isolated human, primate, rodent,
mammalian, chimeric, humanized and/or CNR-grafted anti-TNF antibodies,
immunoglobulins, their cleavage products, other specified portions and
cariants, as well as anti-TNF antibody compositions, nucleic acids
encoding these, vectors, host cells, methods for producing the antibodies
using a host cell, transgenic animal or transgenic plant or plant cell,
and therapeutic compositions, methods and devices. The antibody, nucleic
and therapeutic compositions and methods are useful for diagnosing or
caid, protein, composition and methods are useful for diagnosing or
treating an anti-TNF related condition, e.g. cancer, anorexia, cachexia,
or an immune, cardiovascular, infectious, and/or neurological disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated human antibody or its fragment binds selectively to KDR. An antibody of the invention has cytostatic activity, and may have a use in gene therapy. The antibody is anti-KDR antibody. The antibody is useful for preparing a composition for reducing tumour growth and inhibiting angiogenesis. The present sequence is used in the exemplification of the invention.

This invention relates to a novel fusion protein which comprises a transferrin protein exhibiting reduced glycosylation fused to at least one antibody variable region. The invention may be useful for the development of compounds with cytostatic, antibacterial, virucide, antiparasitic, immunosuppressive or antiarthritic activity. In addition, the sequences disclosed may be useful for gene therapy. The fusion protein is useful for preparing a composition for treating a disease or disease symptom in a parient for example septic shock, endotoxic shock, cachexia syndromes associated with bacterial, viral or parasitic infections, neoplasm, autoimmune disease, arthritis or adverse effects associated with treatment for preventing graft rejection. The present sequence is that of a CDR I peptide which was used in the exemplification
                                                                                                                                                                                                                             New fusion protein comprising a transferrin protein exhibiting reduced glycosylation fused to at least one antibody variable region, useful for preparing a composition for treating e.g., septic shock, neoplasm or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody; antigen binding site; vascular endothelial growth factor; VEGF receptor; immunoglobulin; tumour; angiogenesis; cytostatic; immunostimulant; vaccine; kinase insert domain-containing receptor; KDR; human; CDR; complementarity determining region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel fusion protein which comprises a transferrin protein exhibiting reduced glycosylation fused to at least one antibody variable region. The invention may be useful for the development of compounds with cytostatic, antibacterial, virucide, antiparasitic, immunosuppressive or antiarthritic activity. In addition, the sequences disclosed may be useful for gene therapy. The fusion protein is useful for preparing a composition for treating a disease or disease symptom in a patient for example septic shock, endotoxic shock, infections, neoplasm, autoimmune disease, arthritis or adverse effects associated with treatment for preventing graft rejection. The present sequence is that of a CDR I peptide which was used in the exemplification
                                                                                                                                                                                                                                                                                                                                         New fusion protein comprising a transferrin protein exhibiting reduced glycosylation fused to at least one antibody variable region, useful for preparing a composition for treating e.g., septic shock, neoplasm or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fusion protein, transferrin protein, glycosylation,

The invention relates to a novel antibody having a first antigen binding site specific for a first vascular endothelial growth factor (VEGF) creceptor and a second antigen specific for a second vEGF receptor. The invention further relates to: an antibody that specifically binds to an extracellular domain of a first VEGF receptor and an extracellular domain of a first VEGF receptor and an extracellular domain of a first VEGF receptor and an extracellular domain of a second VEGF receptor, where binding of that vEGF receptor; a method for making the antibody by co-expressing in a host cell a method for making the antibody by co-expressing in a host cell a menoglobulin light chain variable domain; a recombinant DNA construct immunoglobulin light chain variable domain; a recombinant DNA construct chain variable domain located to the N-terminus of the first cantibody; a method for neutralizing activation of a first VEGF receptor cantibody; a method for neutralizing activation of a first VEGF receptor and the second VEGF receptor in a cell by treating a cell with the antibody cited above; a method for reducing tumour growth in a mammal by creating the mammal with the antibody of cred above; an enthod for reducing tumour growth in a mammal by cantibody ited above. The antibody died sycostatic and immunostimulant activities. The VEGF receptor antigen can be used to create a vaccine. The antibody is useful for reducing tumor growth in a mammal and for inhibiting andjogenesis. This sequence represents a human kinase insert domain. Containing receptor binding Fabs complementarity determining
New antibody having a first and second binding sites specific for a first and second vascular endothelial growth factor (VBGF) receptor, useful for reducing tumor growth in a mammal and for inhibiting angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    region (CDR) peptide of the invention.

The present sequence is that of complementarity determining region 1 (CDR1) of the human anti-interleukin-1 receptor type 1 (IL-1R1) monoclonal antibody (MAD) 26F5 and 27F2 light chain variable region ADM41547. Anti-IL-IR antibodies of the invention may comprise this CDR. ADM41547. Anti-IL-IR antibodies of the invention may comprise this CDR. These antibodies inhibit IL-1 signalling by competing with IL-1beta and IL-1alpha binding to IL-IR. Monoclonal antibodies, Rab antibodies, Rab antibodies, Fab antibodies and (Rab')2 antibodies, rate used in methods of treating IL-1 mediated diseases include acute pancreatitis, amyotrophic lateral conferration and (Rab')2 antibodies, are used in methods of treating IL-1 conferrated diseases include acute pancreatitis, amyotrophic lateral sclerosis, Alzheimer's disease, cachexia, anorexia, asthma.

                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel isolated human monoclonal antibody which binds to human CD20 (human B-lymphocyte-restricted differentiation antich binds to human CD20 (human B-lymphocyte-restricted differentiation cantigen or B935). The invention may be useful for the production of compositions with a cytostatic, antipsoriatic, antiasthmatic, neuroprotective, ophthalmological, nephrotropic, antiasthmatic, antiatrerisoslercotic, antianemic, antiatrhritic, antiatrerisoslercotic, antianemic, antiatrhritic, antithyroid or anti-HIV activity. In addition the invention may be useful for gene therapy. The invention is useful for diagnosing, preventing or treating diseases or disorders involving cells expressing CD20, such as cancer, psoriasis, inflammatory bowel disease, meningitis, uveitis, cancer, psoriasis, antimorance, meningitis, uveitis, alementia, myasthenia gravis, rheumatoid arthritis, Graves' disease or HIV. The anti-idiotypic antibody is used for detecting the clease or HIV. The anti-idiotypic antibody is used for detecting the sequence is that of a human complimentarity determining peptide (CDR) peptide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This invention relates to a novel isolated human monoclonal antibody which binds to human CD20 (human B-lymphocyte-restricted differentiation antigen or BD35). The invention may be useful for the production of compositions with a cytostatic, antipsoriatic, antiinflammatory, neuroprotective, ophthalmological, nephrotropic, antiasthmatic, antiarteriosclerotic, antianaemic, antitheumatic, antiarthritic, antithyroid or anti-HIV activity. In addition the invention may be useful for gene therapy. The invention is useful for diagnosing, preventing or treating diseases or disorders involving cells expressing CD20, such as cancer, psoriatis, inflammatory bowel disease, meningitis, uvettis, cancer, psoriatis, inflammatory bowel disease, meningitis, uvettis, alomentulonephritis, asthma, atherosclerosis, multiple sclerosis, haemolytic anaemia, myasthenia gravis, theumatoid arthritis, Graves' disease or HIV. The anti-idiotypic antibody is used for detecting the level of human monoclonal antibody against CD20 in a sample. The present sequence is that of a human complification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          human monoclonal antibody; CD20; human B-lymphocyte-restricted differentiation antigen; Bp35; cytostatic; antipsoriatic; antiinflammatory; neuroprotective; ophthalmological; nephrotropic; antiatehmatory; neuroprotective; ontianemmic; antiatretriosclerotic; antianemmic; antithyroid; anti-HIV; gene therapy; cancer; psoriasis; inflammatory bowel disease; meningitis; uveitis; glomerulonephritis; asthema; atherosclerosis; multiple sclerosis; haemolytic anaemia; myasthenia gravis; rheumatoid arthritis; draves, thy, CDR; complimentarity determining region; human.

This invention relates to a novel isolated human monoclonal antibody which binds to human CD20 (human B-lymphocyte-restricted differentiation antich binds to human CD20 (human B-lymphocyte-restricted differentiation antich binds may be useful for the production of compositions with a cytostatic, antipocriatic, antiinflammatory, neuroprotective, ophthalmological, nephrotropic, antiantimatic, antiantific, antitathratic, antiantamenic, antitheumatic, antiathratic, antitathratic, antithyroid or anti-HIV activity. In addition the invention may be useful for gene therapy. The invention is useful for diagnosing, preventing or treating diseases or disorders involving cells expressing CD20, such as cancer, psoriasis, inflammatory bowel disease, meningitis, uveitis, glomerulonephritis, asthma, atherosclerosis, multiple sclerosis, haemolytic ansemia, myasthenia gravis, rheumatoid arthritis, Graves' clisease or HIV. The anti-idiotypic antibody is used for detecting the present sequence is that of a human complamentarity determining peptide (CDR)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; antibody; mAb 3G6; lymphocyte migration; inflammatory bowel disease; Crohn's disease; gastroenteritis; pulmonary inflammatory disease; asthma; chronic bronchitis; graft rejection; psoriasis; eczema; uricaria; scleroderma; autoimmune disease; multiple sclerosis; diabetes; glomerulonephritis; autoimmune thyroiditis; Behcet's syndrome; viral infection; cancer; neoplastic disease; leukaemia; lymphoma; antiinflammatory; antiasthmatic; immunosuppressive; antipsoriatic; dermatological; neuroprotective; antidasetic; nephrotropic; virucide; cytostatic; vasotropic; alphaE integrin; CD103; alphaE-beta7.

This invention relates to novel antibody and antigen-binding fragments of antibodies that bind alphaE-beta7 integrin chains (CD103). Specifically, articofers to the binding of activation induced epitopes present on activated alphaE integrins, where these integrins are activated by exposure to divalent cations (e.g. Mn2+), to phorbol esters or suitable growth factors and/ or mitogens. The present invention describes the alphaE-beta7 integrin as a homing receptor that mediates lymphocyte migration to mucosal epithelium. As such, compositions of this invention are useful for treating a subject having an inflammatory bowel disease or gastroenteritis or pulmonary inflammatory diseases such as asthms and chronic bronchitis. Furthermore, such compositions can be used for inhibiting graft rejection, psoriasis, compositions can be used for inhibiting graft rejection, psoriasis, compositions and chronic bronchitis. Furthermore, such as cerema, urticaria, scleroderma, autoimmune diseases such as multiple sclerosis, diabetes, glomerulonephritis, autoimmune thyroiditis, Behoct's syndrome, viral infections, cancer and/or neoplastic diseases such as antisafination, immunosuppressive, antipsoriatic, dermactological, neuroprotective, antidabetic, nephrotropic, virucide, cytostatic and vasctropic activities. This peptide sequence is a human antibody heavy contain antibution of the integrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tumour necrosis factor; TNF; immunotherapy; TNF related diseases; obesity; immune related disease; rheumatoid arthritis; cardiovascular disease; stroke; malignant disease; leukaemia; neurological disease; multiple sclerosis; infection; hepatitis; anorectic; antiarthritis; cerbroprotective; vasotropic; cytostatic; neuroprotective; antibacterial; antiinflammatory; hepatotropic; virucide; anti-TNF antibody; CDR; complementarity determining region; human;
                                                                                                                                                                                                              Novel antibody which binds activated alpha-E integrin, specifically to activation-induced epitope on integrin alpha-E chain (CD103), useful for treating inflammatory bowel diseases e.g., Crohn's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention relates to a mammalian anti-tumour necrosis factor (TNF) antibody capable of inhibiting binding of TNF alpha to TNF receptor. The invention is useful for diagnosing or treating an anti-TNF related condition in a cell, tissue, organ or animal and in immunocherapy. The invention is also useful for treating TNF related diseases chosen from obesity, immune related disease such as rheumatoid as tribritis, cardiovascular disease such as stroke, malignant disease such as leukaemia, neurological disease such as multiple sclerosis and bacterial or viral infections such as hepatitis. The present sequence is the human anti-TNF antibody light chain complementarity determining
                                                                                                                                                                                                                                                                                 Novel isolated mammalian anti-tumor necrosis factor (TNF) alpha antibody capable of inhibiting binding of TNF alpha to TNF receptor, useful for treating TNF-related diseases such as obesity or rheumatoid arthritis.

or fragment New composition comprising a multimeric form of an antibody or fragm which specifically binds an antigen-presenting portion of a complex, useful for treating pathogen-associated diseases e.g., HIV.

Claim 5; SEQ ID NO 35; 68pp; English.

The invention relates to a composition-of-matter comprising (a multimeric form of) an antibody or antibody fragment including an antigen-breaching creeding and antibody or antibody presenting portion of a complex composed of a human antigen-presenting molecule and an antigen presenting of creeding a perhapsing an antigen presenting molecule and an antigen of carived from a pathogen. Also included are an isolated polyuncleotide carived from a pathogen, a nucleic acid construct comprising an antigen-breaching portion of a complex composed of a human antigen-presenting molecule and an antigen derived from a pathogen), a nucleic acid construct comprising the isolated construct above, a host virus comprising the solated construct above, a host virus comprising the muclaic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus comprising the nucleic acid construct above, a host virus composed of a human antigen-presenting molecule and an antigen derived (construct above, an antigen-presenting molecule and an antigen derived (construct above, an antigen-presenting molecule and an antigen derived (construct a pathogen) and amethod of a complex as described and an antigen derived (construct a pathogen) and antigen-presenting molecule and an antigen derived from a pathogen an antigen-presenting portion of a complex of a described and an antigen derived from a pathogen and antigen-presenting cell, which is a recognition equal and antigen-presenting acide and an antigen-presenting acide and antigen-presenting acide and antigen-presenting antigen derived from a pathogen in antigen-presenting as an ecognition of a south antigen derived from a pat

ADS52432
```

The invention relates to a composition-of-matter comprising (a multimeric form of) an antibody or antibody fragment including an antigen-binding region capable of specifically binding an antigen-presenting portion of a complex composed of a human antigen-presenting molecule and an antigen derived from a pathogen. Also included are an isolated polymucleotide derived from a pathogen. Also included are an isolated polymucleotide comprising an antigen-presenting molecule and antibody fragment the comprising an antigen-presenting portion of a complex composed of a human antigen-presenting molecule and antigend from a pathogen). A mucleic acid construct comprising the isolated from a promoter sequence for directing transcription of the isolated polymucleotide above (and a promoter sequence for directing transcription of the isolated polymucleotide in a host cell), a host cell comprising the nucleic acid construct above, a virus comprising the nucleic acid construct above, a virus comprising the nucleic acid construct above, a virus comprising a cat comprising conformation of a complex composed of a human antigen-presenting molecule and an antigen expressing displaying an antigen-presenting portion of a complex of composed of a human antigen-presenting molecule and an antigen and antigen presenting molecule and an antigen appresenting molecule and an antigen and antigen-presenting molecule and an antigen and antigen-presenting molecule and an antigen antigen-presenting molecule and an antigen and antigen-presenting molecule and an antigen and antigen-presenting molecule and an antigen and antigen-presenting molecule and an antigen and antigen-presenting molecule and an antigen antigen-presenting molecule and antigen presenting cell, which is a T lymphocyte or an antigen-presenting molecule and antigen presenting cell, which is a T lymphocyte or an antigen-presenting cell, which is a succeeded cell is a T lymphocyte or an antigen-presenting cell, which is a complex and cetectable molecule, as erceptavidin molecule. A c

The antigen derived from a pathogen is restricted by the antigen
C presenting molecule and is a polypeptide selected from a segment of a viral oncoprotein or a segment of a Tax protein. A pharaceutical composition comprising as an active ingredient the composition-of-matter is useful in a method for treating a disease associated with a pathogen in an individual such as viruses (HIV), mycoplasmas, bacteria, fungi and proteoms. The composition-of-matter or the methods are useful for c diagnosing an infection by a pathogen in an individual and for killing or c diagnosing at arget cell expressing or displaying an antigen-presenting or complex composed of a human antigen-presenting molecule and can antigen derived from a pathogen. A phase displayed library of human complex complex or complex composed of a human antigen presenting molecule and an ested for specific binding to HLA-A2/Tax 11-19 complex was generated and their CDR (complementarity determining region) sequences compared. The present sequence is a CDR from the light chain of an isolated Fab clone.

(GENE-) GENESTO AS

Lundgren JD, Kempe TD; Sorensen AP, Benfield TL,

WPI; 2005-101476/11. N-PSDB; ADW07068 New binding member towards Streptococcus pneumoniae surface adhesin A protein, useful for treating or preventing pneumonia, meningitis and/or New binding вервів.

Disclosure; SEQ ID NO 18; 137pp; English.

The invention describes an isolated binding member comprising at least one binding domain capable of specifically binding Streptococcus pneumoniae surface adhesin A (PsaA) protein, the binding domain having a dissociation constant Kd for PsaA which is less than 1 x10 -6 M. Also described are: an isolated nucleic acid molecule encoding at least a part of the binding member described above; a vector comprising the nucleic

```
ö
acid molecule of (1); a host cell comprising the nucleic acid molecule of (1); a cell line engineered to express the binding member described above. A detecting or diagnoshing a disease or disorder associated with preumococcus in an individual; a kit comprising at least one binding member described above, the antibody being labeled; and a pharmaceutical composition comprising at least one binding member described above. The binding member is useful for producing a pharmaceutical composition are useful for producing a pharmaceutical composition are useful for treating or preventing an individual suffering from disorders or diseases associated with S. pneumoniae, e.g. pneumonia, meningitis and/or sepsis. This sequence encodes anti-pneumococcal surface adhesin A (BeaA)-antibody 1-15ES kappa light chain variable region complementarity determining region 1 (CDR1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated binding member comprising at least one binding domain capable of specifically binding Streptococcus pneumoniae surface adhesin A (PeaA) protein, the binding domain having a dissociation constant Kd for PeaA which is less than 1 x10 -6 M. Also described are: an isolated nucleic acid molecule encoding at least a part of the binding member described above; a vector comprising the nucleic acid molecule of (1); a host cell comprising the nucleic acid molecule of (1); a cell line engineered to express the binding member described above; detecting or diagnosing a disease or disorder associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibacterial; antiinflammatory; immunosuppressive; antibody engineering; pharmaceutical; infection; pneumonia; meningtis; sepsis; pneumococcal surface adhesin A; PsaA; light chain variable region; complementarity determining region 1; CDR1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New binding member towards Streptococcus pneumoniae surface adhesin A
protein, useful for treating or preventing pneumonia, meningitis and/or
                                                                                                                                                                                                                                                                                                                                                                         Gaps

Pneumococcus in an individual; a kit comprising at least one binding member described above, the antibody being labeled; and a pharmaceutical composition comprising at least one binding member described above. The binding member is useful for producing a pharmaceutical composition for the treatment of Pneumococcus infection. The binding member, methods and composition are useful for treating or preventing an individual suffering from disorders or diseases associated with S. pneumoniae, e.g. pneumonia, meningitis and/or sepsis. This sequence encodes anti-pneumococcal surface adhesin A (PsaA)-antibody 947 kappa light chain variable region complementarity determining region 1 (CDR1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to novel proteins (I) that bind to pregnancy-associated plasma protein A (PAPP-A ADW04676). (I) comprises a first and second immunoglobulin variable domain sequence which binds to PAPP-A. Also claimed are proteins (II) which comprise light chain (LC) and heavy chain immunoglobulin variable domain sequences which binds to PAPP-A. The proteins are useful for diagnosing, preventing or treating proliferative diseases such as glioblastoma, osteosarcoma and overgrowth of vascular smooth muscle cells following e.g., balloon angioplasty (which may cause resenosis). The proteins are sepecially useful for useful for treating diseases involving IGF regulated growth. The present sequence is one such immunoglobulin variable domain sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PAPP-A immunoglobulin variable domain AB d06 light chain CDR1 SEQ ID 232
                                                                                                                                                                                                                                                                                                Gaps

Life invention of NGF. Also described are: methods of treating a condition caused by increased expression of NGF or increased sensitivity to NGF in a patient; methods for detecting NGF or increased sensitivity to NGF in a patient; methods for detecting NGF in a biological sample; an NGF or patient; methods for detecting NGF in a biological sample; an NGF or caused by increased expression of NGF or 14 amino acids, as mentioned in the specification, and where the binding agent can bind to NGF; a pering a pering a paramaceutical carrier and a therapeutic amount of the antibody or binding agent cited above; or a medicament for treating a painful disorder or condition associated with increased expression of NGF or increased sensitivity to NGF, the medicament comprising a paramaceutical amount of a monoclonal antibody or increased sensitivity to NGF, the medicament comprising a pharmaceutical menunologically functional immunoglobulin fragment, or pharmaceutical salts of the monoclonal antibody or the fragment, where the monoclonal antibody is at least one of the monoclonal antibody or binding agent; an antibody is at least one of the monoclonal antibody or binding agent; an isolated cell line that produces the above antibody or binding agent; and solated cell line that produces the above antibody or binding agent; and solated cell line that produces the above antibody or binding agent; and comprising the nucleic acid or expression vector. The composition comprising the antibody) and methodes are useful for manufacturing a medicament for treating a painful disorder (e.g. acute pain, dental pain, or pain from trauma or cancer), or a condition associated with increased expression of NGF or increased sensitivity to NGF. This is the amino acid or expression, or necessed sensitivity to NGF. This is the amino acid or expression of NGF antibody heavy chain complementarity determining New human anti-nerve growth factor (NGF) neutralizing antibodies useful for manufacturing a medicament for treating painful disorders (e.g. acute pain) or conditions associated with increased expression or sensitivity The invention describes an isolated human antibody that interacts with or Claim 38; SEQ ID NO 128; 190pp; English.

Sequence 11 AA

region 1

```
The invention relates to an isolated nucleic acid comprising a sequence encoding a SARS coronavirus (SARS-CoV) spike glycoprotein (S protein), or its fragment, where the sequence has been optimized for expression in a human host. Also described: (1) a nucleic acid expression vector comprising the above nucleic acid; (2) an isolated cell comprising the expression vector of (1); (3) a polypeptide encoded by the above nucleic acid; (4) an isolated polypeptide comprising an extracellular portion of the SARS-CoV S polypeptide located between amino acids 15-1190 of ADY93852, or its fragment; (5) an isolated antibody, or its antigen binding fragment, that specifically binds to the polypeptide of (3); (6) an isolated antibody, or its antigen binds to an antigen binding fragment of an anti-S protein antibody; (7) a composition comprising a polypeptide of (4) or an antibody; (7) a composition comprising a polypeptide of (4) or an antibody; or its carrier; (8) making an sutigen binding fragment, that specifically binds to an antibody, or its carrier; (9) making an antibody, or its antigen binding fragment, that specifically binds to an S protein of SARS-COV; (10) evaluating an antibody, or its antigen binding fragment, that specifically binds to an S SARS-COV; (11) evaluating an antibody, or its antigen binding fragment, that specifically binds for the presence of SARS-COV; (11) evaluating an antibody, or its antigen binding fragment, that specifically binds for the presence of SARS-COV;

```
inhibition of infection by SARS-CoV; (12) treating a subject at risk for, or exposed to SARS-CoV; (13) an immunoconjugate comprising the antibody of (5) linked to a therapeutic agent; (14) an isolated nucleic acid molecule encoding the antibody, its antigen-binding portion, variable heavy chain or variable light chain of (5); (15) an expression vector comprising the nucleic acid molecule of (14); (16) an expression vector immunoglobulin heavy and light chain transgenic mammal comprising human immunoglobulin heavy and light chain transgenic mammal compresses the antibody of (5); (18) a hybridoma prepared from the mammal of (17), where the hybridoma produces the antibody; and (19) preparing an anti-S procein antibody. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of squence from the anti-SARS 201.2 antibody light chain variable region from the present invention.

New protein comprising heavy and light chain immunoglobulin variable domain sequences, useful in preparing a composition for treating or preventing neoplastic or inflammatory disorders.

Example; Page 129; 192pp; English

This invention relates to novel proteins, comprising a heavy chain immunoglobulin variable domain sequence and a light chain immunoglobulin variable domain sequence, which bind to matrix metalloproteinase (MMP)-26 and comprise at least one human complementarity determining region or framework region. The invention may be useful for the development of compounds with a cytostatic, antiinflammanory, osteopathic or antiatrhritic activity whilst the disclosed sequences may prove useful for gene therapy. The protein is useful in preparing a composition for

```
This invention relates to novel proteins, comprising a heavy chain immunoglobulin variable domain sequence and a light chain immunoglobulin variable domain sequence and a light chain immunoglobulin variable domain sequence, which bind to matrix metalloproteinase (MMP)-26 and comprise at least one human complementarity determining region or framework region. The invention may be useful for the development of compounds with a cytostatic, antiinflammatory, osteopathic or antiarthritic activity whilst the disclosed sequences may prove useful for gene therapy. The protein is useful in preparing a composition for treating or preventing neoplastic disclosed sequences may prove to reating or preventing neoplastic disclosed, for example breast, prostate, or lung cancer or inflammatory disorders, for example or rheumatoid arthritis, lupus, restenoiss, graft versus host response or multiple sclerosis or a disorder characterized by excessive or undesired MMP-26 activity, for example periodontitis, rheumatoid arthritis or secentiality. The present sequence is that of a CDR peptide which was used during the development of the novel MMP26-binding antibodies of the
                                                                                                                                                                                                                                                                                         ö
treating or preventing neoplastic disorders, for example breast, prostate, or lung cancer or inflammatory disorders, for example prostate, or lung cancer or inflammatory disorders, for example rehumatorid arthritis, lupus, restenois, graft versus host response or multiple sclerosis or a disorder characterized by excessive or undesired MMP-26 activity, for example periodontitis, rheumatorid arthritis or osteoarthritis. The present sequence is that of a CDR peptide which was used during the development of the novel MMP26-binding antibodies of the

The invention relates to an isolated human monoclonal antibody or an antigen-binding portion, which specifically binds to human IP-10 and exhibits at least one property selected from: Inhibits binding of IP-10 to CXCR3; inhibits IP-10 induced calcium flux; inhibits IP-10 induced call migration; cross-reacts with rhesus monkey IP-10; does not cross-react with mouse IP-10; does not cross-react with human ITAC. The isolated human monoclonal antibody is cross-react with human ITAC. The isolated human monoclonal antibody is useful for treating an inflammatory or autoimmune disease including comultiple sclerosis, rhemmatorid arthritis, inflammatory bowel disease (e.g., ulcerative colitis, Crohn's disease), systemic lupus cryhematosus, Type I diabetes, inflammatory skin disease (e.g., Graves, Hashimoto's thyroiditis), Sjogren's syndrome, pulmonary carcoidosis, lymphocytic alveolitis), transplant rejection, pulmonary sarcoidosis, lymphocytic alveolitis), transplant rejection, spinal cod injury, brain injury (e.g., stroke), neurodegenerative diseases (e.g., Alzheimer's disease, Parkinson's disease), gingivitis, cheese therapy-induced inflammation, diseases of angiogenesis, inflammatory

ö
kidney disease (e.g., IgA nephropathy, membranoproliferative glomerulonephritis), rapidly progressive glomerulonephritis), or atherosclerosis. It is also useful for treating a viral or bacterial infection involving unwanted IP-10 activity in a subject, where the viral infection is mediated by HIV, HCV, HSV-1 or SARS virus. The present sequence represents the amino acid sequence of a human IP10 monoclonal antibody light chain variable region, CDR1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated human monoclonal antibody or an antigen-binding portion, which specifically binds to human interferon gamma inducible protein 10 (IP-10), useful for treating viral or bacterial infection, or inflammatory or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated human monoclonal antibody or an antigen-binding portion, which specifically binds to human IP-10 and exhibite at least one property selected from: inhibits binding of IP-10 to CXCR3, inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced calcium flux; inhibits IP-10 induced cross-react with human ITAC. The isolated human monoclonal antibody is useful for treating an inflammatory or autoimmune disease including multiple sclerosis, rheumatoid arthritis, inflammatory bowel disease (e.g., ulcerative colitis, Crohn's disease), systemic lupus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antibody; IP-10; inflammation; immune disorder; dermatological disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

ö
psoriasis, lichen planus), autoimmune thyroid disease (e.g., Graves' disease, Hashimoto's thyroiditis), Sjogren's syndrome, pulmonary disease, Inflammation (e.g., asthma, chronic obstructive pulmonary disease, pulmonary disease, pulmonary disease, pulmonary disease, pulmonary disease, pain injury, (e.g., stroke), neurodegenerative diseases (e.g., Alzheimer's disease, Parkinson's disease), gingivitis, gene therapy-induced inflammation, diseases of angiogenesis, inflammatory kidney disease (e.g., IgA nephropathy, membranoproliferative glomerulonephritis, rapidly progressive glomerulonephritis), or atherosclerosis. It is also useful for treating a viral or bacterial infection involving unwanted IP-10 activity in a subject, where the viral sequence represents the amino acid sequence of a human IP10 monoclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition-of-matter which comprises an antibody or antibody fragment or a multimeric form of an antibody or antibody reagment including an antigen-binding region capable of specifically binding an antigen-presenting portion of a complex composed of a human antigen-presenting molecule (APM) and an antigen presenting molecule (APM) and an antigen from a pathogen. The invention is useful for the specific detection of the antigen-presenting portion of the complex and for diagnosing/treating various types of diseases associated with a pathogen infection by killing/damaging pathogen infected cells. The present sequence is a complementarity determining regions (CDR) of Fab light chain antibody specifically binding human leukocyte antigen (HLA-A2)/Tax11-19 complex. Tax11-19 is an antigen derived from Human T-lymphotropic virus 1 (HTLV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition-of-matter capable of specifically binding an antigen-presenting molecule and a pathogen-derived antigen complexes, useful for treating diseases associated with a pathogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human CDR1 of T4B7 Fab specifically binding HLA-A2/Tax11-19, SEQ: 83.
                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosis; therapeutic; infection; antimicrobial; light chain; T4B7.
                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                               Length 11;

                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a composition-of-matter which comprises an antibody or antibody fragment or a multimeric form of an antibody or antibody remainent including an antigen-binding region capable of specifically binding an antigen-presenting portion of a complex composed of a human antigen-presenting molecule (APPM) and an antigen presenting molecule (APPM) and an antigen form antigen-presenting portion of the specific detection of the antigen-presenting portion of the complex and for diagnosing/treating various types of diseases associated with a pathogen infection by killing/damaging pathogen infected cells. The present sequence is a complementarity determining regions (CDP) of Fab light chain antibody specifically binding human leukcoyte antigen (HLA-A2)/Tax11-19 complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition-of-matter capable of specifically binding an antigen-
presenting molecule and a pathogen-derived antigen complexes, useful for
treating diseases associated with a pathogen.

The invention relates to a novel isolated human monoclonal antibody comprising a human heavy chain variable region and a human light chain variable region both comprising FR (framework region)-1, CDR (complementarity determining region)-1, FR2, CDR2, FR3, CRD3 and FR4 sequences. The antibody is directed against the human prostate specific membrane antigen (FSMA). The monoclonal antibody of the invention preventing a disease characterised by the growth of treating or preventing a disease characterised by the growth of tumour calls such as cancer, particularly prostate cancer, colon cancer or renal carcinoma, as well as duing gene therapy procedures. The current sequence is that of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of making a humanised antibody, comprising making chimeric antibodies containing a complementarity determining region (CDR) from a non-human antibody and appropriate framework sequences (I) of human antibodies. (I) is selected by using canonical CDR structure types of human antibodies as the basis for selection, for humanisation. The method is useful for making a humanised antibody or a converted antibody. The method is applicable for converting a subject antibody sequence of any subject species to a less immunogenic form suitable for use in an object species. The method is reliable for identifying suitable human framework sequences to support non-human CDR regions and to provide humanised antibodies that retain confort regions and to provide humanised antibodies that retain the nation of framework sequences, without the need for direct comparison of framework sequences, without the need for determining critically important amino acid residues in the framework, unanised antibodies with maintable therapeutic properties. The antibody framework is that high affinity and low immunogenicity without need for comparing the formanised antibodies with minimals therapeutic properties. The antibody framework is the first of the first of the formal sed antibodies with minimals therapeutic properties. The antibody framework is the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of the first of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   framework sequences between non-human and human antibodies. This sequence represents a human light chain variable region gene segment used in the
                                                                                                                                                                                                                                                                                                                                                                                          Making humanized antibody for converting antibody, by making chimeric antibodies containing complementarity determining region from non-human antibody and appropriate framework sequences of human antibodies.

The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody, especially the stability, solubility, or antigen blinding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```

The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure;

```
structure; selecting at least one amino acid to be considered at the variable position(8); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody, especially the stability, solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody variable region sequence used to illustrate the invention.
selecting at least one variable position belonging to the antibody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                              physico-chemical property of an antibody by a computational screening physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position with at least part of the remainder of the antibody, including the selected amino acids at coher variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions, and identifying a set of at least one antibody sequence with at least one optimized physico-chemical property. The method is useful for optimizing solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                             The present invention relates to a method for optimizing at least one

The invention relates to a method of producing a hybrid antibody or hybrid antibody fragment by: (i) providing an initial antibody having expecificity for a target; (ii) determining the sequence of a variable region of the initial antibody; (iii) selecting a first component of the region of the first component to sequences contained in a reference sequence of the first component to sequence from a reference catabase of antibody sequences or antibody fragment sequences from a target species; (v) selecting a sequence from an antibody in the database which demonstrates a high degree of homology to the first component; (vi) selecting a second component of the variable region which is different that the first component, the second component selected from the group consisting of FRI, FR2, FR3 and FR4; (vii) comparing the sequence of the second component to sequence contained in a reference database of second component to sequence something in a reference of the cantibody sequences or antibody fragment sequences from the target species (viii) selecting a sequence from the database which demonstrates a high degree of homology to the second component and which is from a different
                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Producing a hybrid antibody or hybrid antibody fragment by operatively linking the selected framework sequences to one or more complementarity determining regions of the initial antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                              hybrid antibody; antibody; framework region; homology; immunogenicity.

```

```
cc antibody than the selected antibody; and (ix) operatively linking the selected framework sequences to one or more complementarity determining cc regions (CDRs) of the initial antibody to produce a hybrid antibody or CC regions (CDRs) of the initial antibody to producing a hybrid antibody fragment. The method is useful for producing any hybrid cantibody or hybrid antibody fragment (claimed). The antibody and CC fragments are useful for therapeutic and diagnostic purposes. The method CC uses enrire framework regions from a single antibody variable heavy or CC variable light chain to receive the CDRs. This produces antibodies that CC are highly homologous and exhibit reduced immunogenicity while maintaining an optimum binding profile. This sequence represents the CC amino acid sequence of an antibody from the Vkappa gene locus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ठ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 8

US-09-434-870-2

i Sequence 2, Application US/09434870

i Patent No. 6849425

i GENERAL INFORMATION:

i APPLICANT: Huse, William

i APPLICANT: Waskins, Jeffry

APPLICANT: Wu, Herren

i TILE OF INVENTYON: Methods of Optimizing Antibody Variable Region Binding Affinity

i TILE OF INIVENTYON: Methods of Optimizing Antibody Variable Region Binding Affinity

FILE REPRENCE: AME-06352

CURRENT APPLICATION NUMBER: US/09/434,870

CURRENT APPLICATION NUMBER: 60/159,689

PRIOR APPLICATION NUMBER: 60/159,689

PRIOR FILING DATE: 1999-10-14

NUMBER OF SEQ ID NOS: 4

SOFTWARE: PatentIn version 3.0

LENGTH: 107

TYPE: PRT

CRANISM: Homo sapiens
